

# 4x4x4 Cube Synthesizer – Centers

## Introduction

**Revenge Cubes** are **4x4x4** cubes. They may be solved for a *single* face out of six to display pictures or patterns on a selected front face.

A way of solving a single face is first to solve the 4 centers, then the 4 dedges (double edges) and finally the 4 remaining corners cubes. This is very similar to the method used for solving the *first* layer of a regular Revenge Cube.

By twisting and rotating some parts of the cube, it is possible to move selected cubelets from any face to the front face. Note that each letter, number or symbol on a solved face should have the right orientation, i.e. should generally be oriented North ( $0^\circ$ ).

Maneuvers used for twisting and rotating parts of a cube are coded as a series of letters called an *algorithm*. An algorithm is then a code for a sequence of moves used to change the state of a cube from an *initial* (unsolved) state to a *final* (solved) state.

The *initial* state of a cube is given by a particular layout of letters, numbers and symbols shown on the cube *texture* whereas the *final* state is given by what we would like to see displayed on a selected front face. This is where we would need a software tool for *automatically* generating an algorithm to set the cube to a *user-selected* final state. This is what is called *synthesis*, which is just the reverse of *analysis*. and the software tool to do this is called a *Synthesizer*. The Synthesizer input data is the *final* state data.

Basic algorithms are used to change the state of each front face cubie from an initial to a final state. Synthesized algorithms are then basic algorithms that have been concatenated.

## 4x4x4 Cube Centers: Notations

Isolated (or strings of) letters, numbers, characters, symbols or pictures are placed on center cubies. These may be oriented **N**orth (0°), **E**ast (90°), **S**outh (180°) or **W**est (270°). Center cube notations are abbreviated as follows:

- Center **T**op **L**eft (**CTL**)
- Center **T**op **R**ight (**CTR**)
- Center **B**ottom **L**eft (**CBL**)
- Center **B**ottom **R**ight (**CBR**)

# Algorithm Synthesizer

## Introduction

A computer program named *CubeSynthesizer4C* has been designed for synthesizing algorithms for moving center cubelets on 4x4x4 cubes that need to be solved for a *single* face. The program has been developed using Microsoft Office Excel and Visual Basic Editor. There is only a Developer's version of this program available at present.

The program can be used as follows:

- 1- Open *CubeSynthesizer4C* in Excel
- 2- Press Ctrl+Shift+S to display the Synthesizer Input Form
- 3- Select a cube from the Form
- 4- Click the OK Button and wait until algorithm synthesis is completed
- 5- Browse through the list of synthesized algorithms in Worksheet 'Main'
- 6- Copy a selected algorithm in [CubeTwister](#) or in an applet

## Algorithms

A 4x4x4 Reference Cube has been used to check basic algorithms and to fill in lookup tables with numbers indicating the cube state. All basic algorithms are based on *commutators* and do not modify any facelet on the *Front* face other than the origin or destination facelets. A *complete* algorithm for a whole front face would then need up to 16 basic algorithms whereas a composite algorithm for the 4 centers is obtained by *concatenating* a maximum of 5 basic algorithms.

Synthesized algorithms are basic algorithms that have been concatenated. Finding basic algorithms can be done *manually* by searching the path of letter 'A' on a [cube wire grid model](#), from an initial to a final location. The tip of Letter 'A' is used to show the orientation of a facelet.

## Short Program description

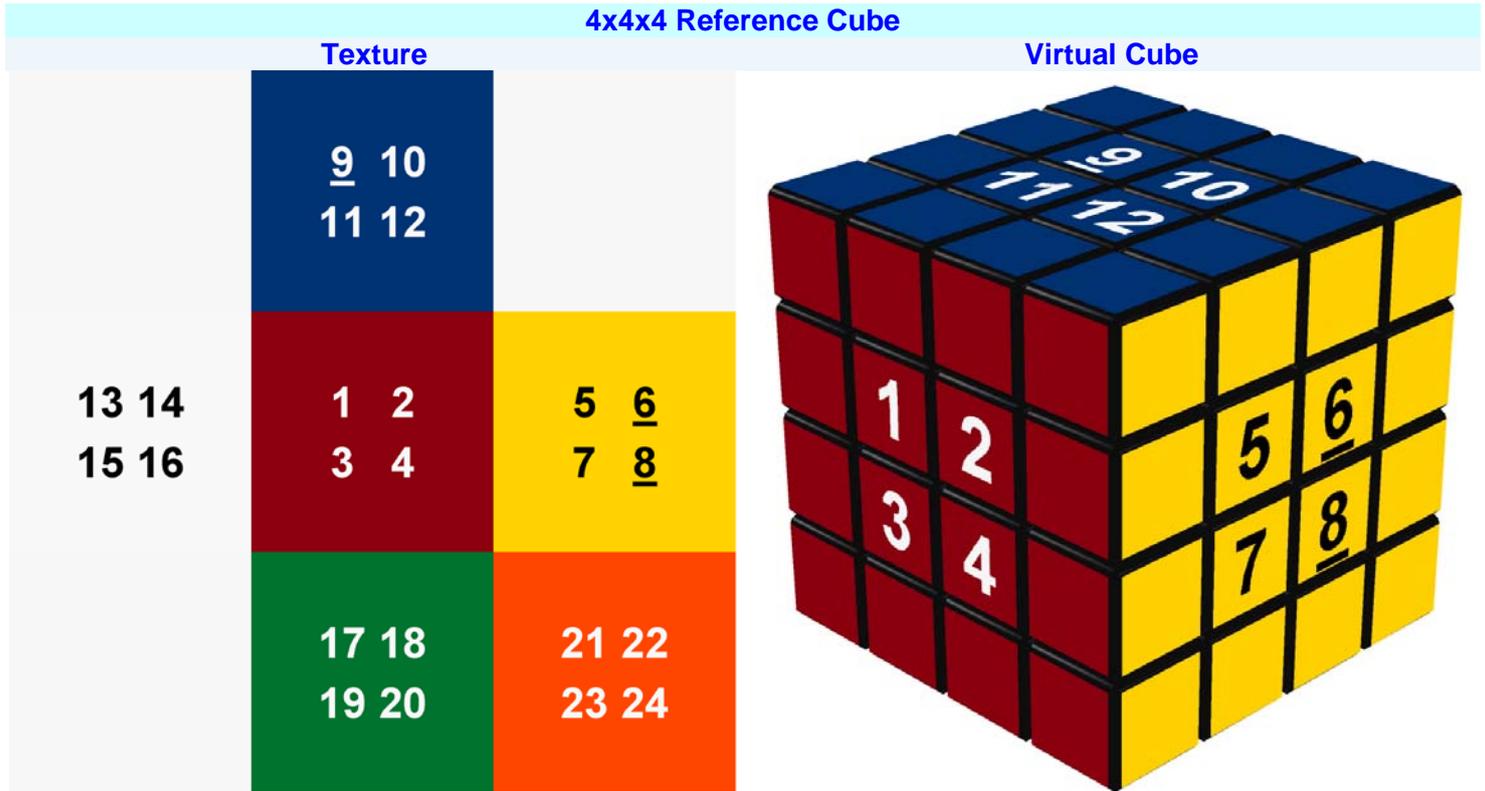

There are 5 steps for solving the 4 centers on a front face. Step 0 is the first step, used to bring any of the 6 faces on front, with the correct orientation. Step 0 is simply a combination of cube rotations. Steps 1 to 4 are then applied CW (ClockWise), 1 step per center facelet. There is an option for optimizing the order of steps 1 to 4 to find the shortest length algorithm. In this case, algorithms are computed for  $4! = 24$  sequences and the shortest length algorithm is selected at the end of the optimization process. These sequences are shown in the Table below.

Algorithm Length Optimization – The 24 Sequences of Steps											
1	2	3	4	5	6	7	8	9	10	11	12
Step 1	Step 1	Step 1	Step 1	Step 1	Step 1	Step 2	Step 2	Step 3	Step 3	Step 4	Step 4
Step 2	Step 2	Step 3	Step 3	Step 4	Step 4	Step 1					
Step 3	Step 4	Step 2	Step 4	Step 2	Step 3	Step 3	Step 4	Step 2	Step 4	Step 2	Step 3
Step 4	Step 3	Step 4	Step 2	Step 3	Step 2	Step 4	Step 3	Step 4	Step 2	Step 3	Step 2
13	14	15	16	17	18	19	20	21	22	23	24
Step 2	Step 2	Step 2	Step 2	Step 3	Step 3	Step 3	Step 3	Step 4	Step 4	Step 4	Step 4
Step 3	Step 3	Step 4	Step 4	Step 4	Step 4	Step 2	Step 2	Step 2	Step 2	Step 3	Step 3
Step 4	Step 1	Step 1	Step 3	Step 1	Step 2	Step 4	Step 1	Step 1	Step 3	Step 1	Step 2
Step 1	Step 4	Step 3	Step 1	Step 2	Step 1	Step 1	Step 4	Step 3	Step 1	Step 2	Step 1

For each step, basic algorithms are automatically selected in look-up tables. A synthesized algorithm is then obtained by concatenating 5 basic algorithms. In order to shorten the synthesized algorithm length, *trivial* combinations between successive basic algorithms such as **B B'** or **MF MF'** are suppressed or simplified when concatenating basic algorithms.

# Examples

## Example #1: 4x4x4 Reference Cube

### 4x4x4 Reference Cube – Basic Algorithms Examples

Step 1: From R [CTL, N] To F [CTL, N]

Step 2: From U [CBR, E] To F [CTR, N]

Number '5' is brought from face **R** to face **F** (+0°)

MF' MU' MF MU

Number '12' is brought from face **U** to face **F** (+270°)

MU MF' MU' MF

### Basic Algorithms (Commutators)

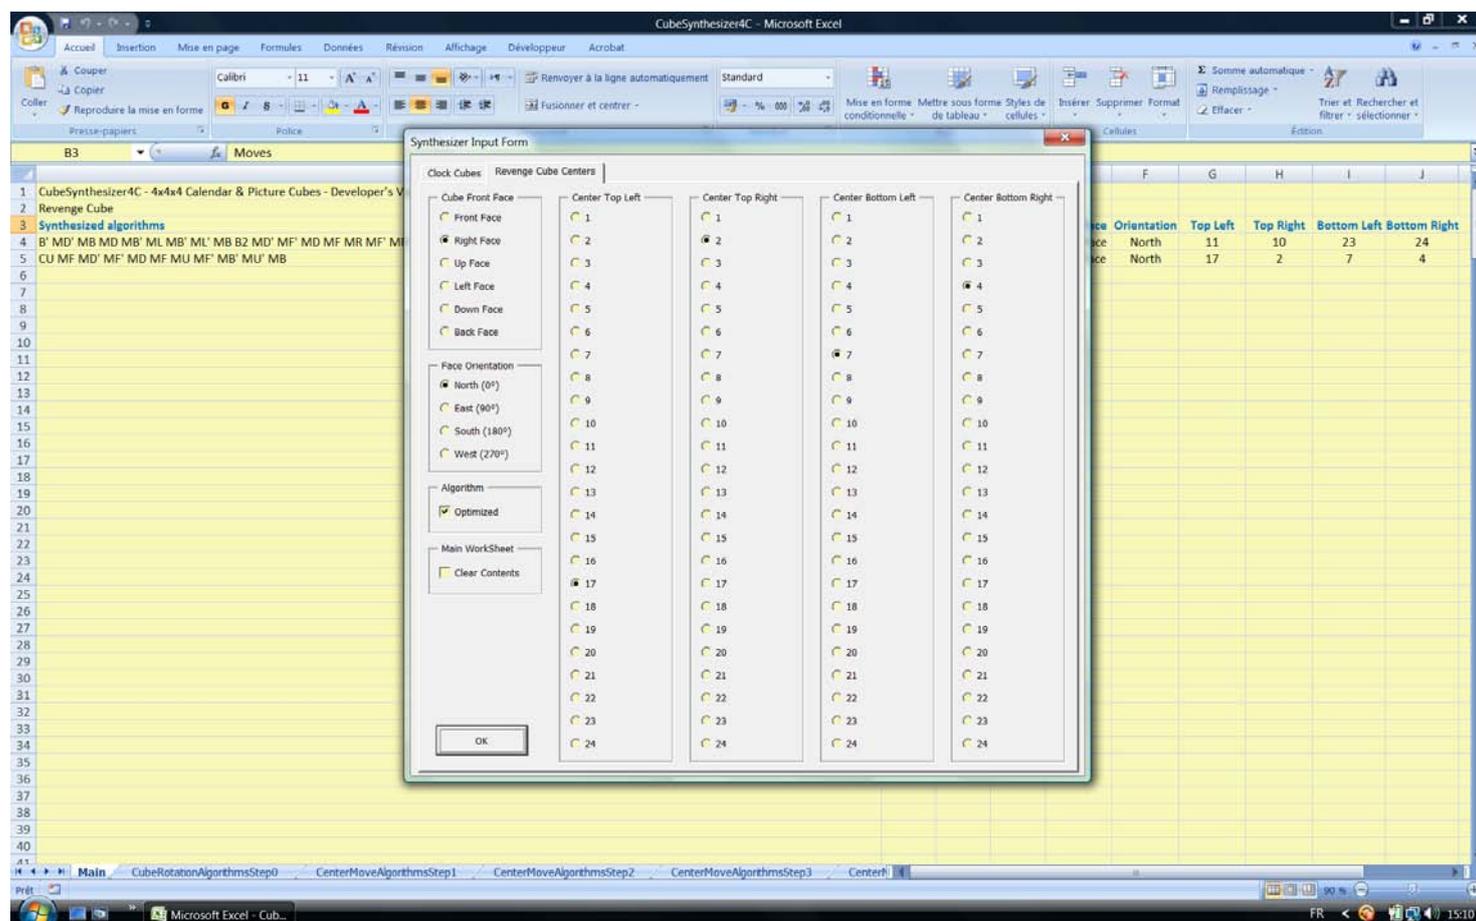

A 4x4x4 Reference Cube is used to check basic algorithms and fill in lookup tables with numbers indicating the cube state. All basic algorithms are based on *commutators* and do not modify any facelet on the *Front* face other than the origin or destination facelets.

## Example #2: Dot Matrix Cube (Demo)

### Example of a Dot Matrix Screen

### Synthesizer Input Form Example

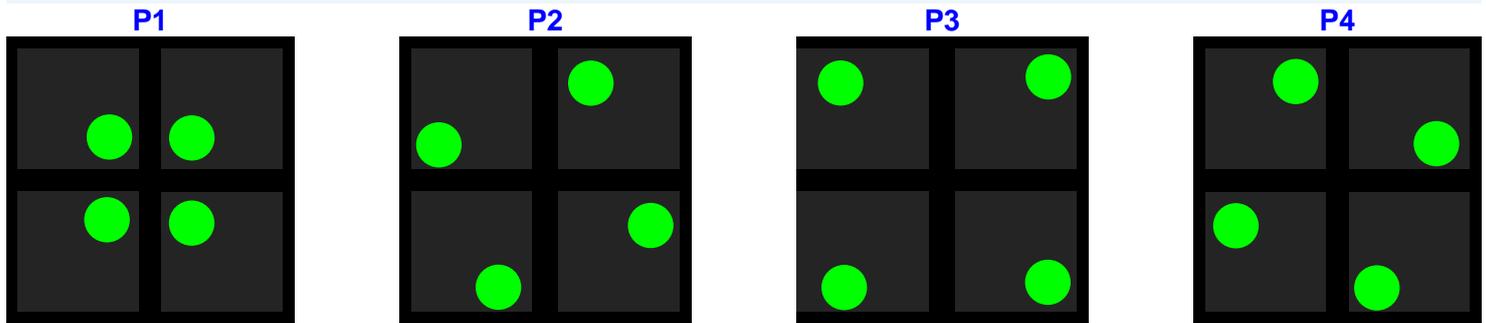

This example shows how to use an Input Form for synthesizing algorithms. We can see that center cubes number 17, 2, 7 and 4 have been selected for displaying letter 'x' on the (North oriented) Right face. Note that by unchecking the 'Clear Contents' CheckBox, algorithms are displayed one after another and stay on screen. Optimized algorithms can also be computed by checking the 'Optimized' CheckBox.

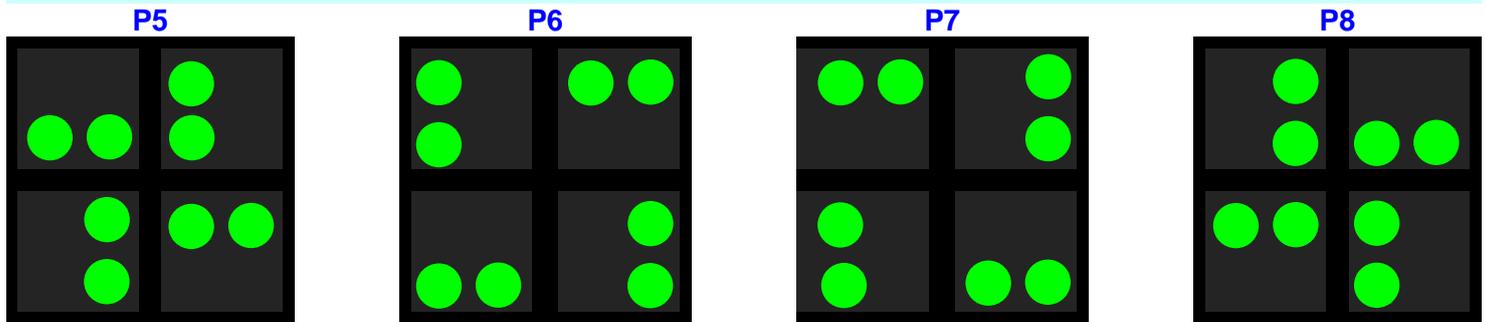

## Dot Matrix Cube Patterns on Center Cubes

### Center Cubes Patterns – Basic patterns Location: CTL

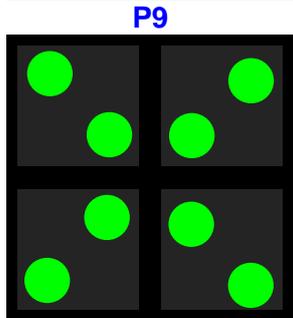

#### 1-dot Patterns – 4 Patterns

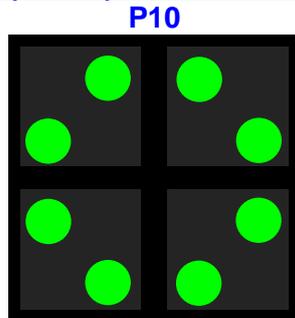

#### 2-dot Patterns – 6 Patterns

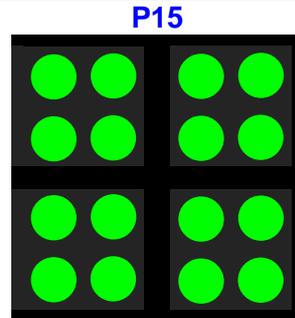

#### 2-dot Patterns (cont'd)

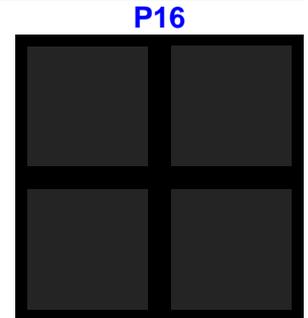

#### 4-dot Pattern

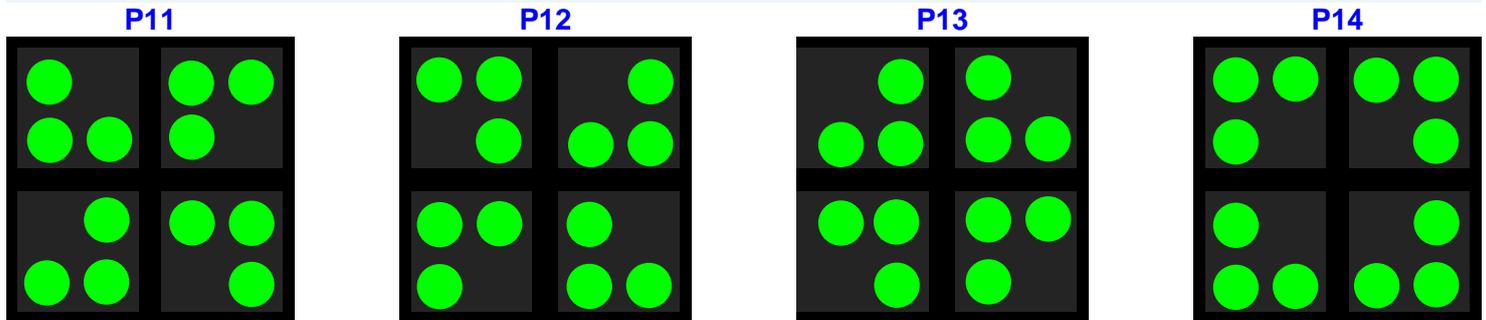

#### 4-dot Pattern

#### 0-dot Pattern

#### 3-dot Patterns – 4 Patterns

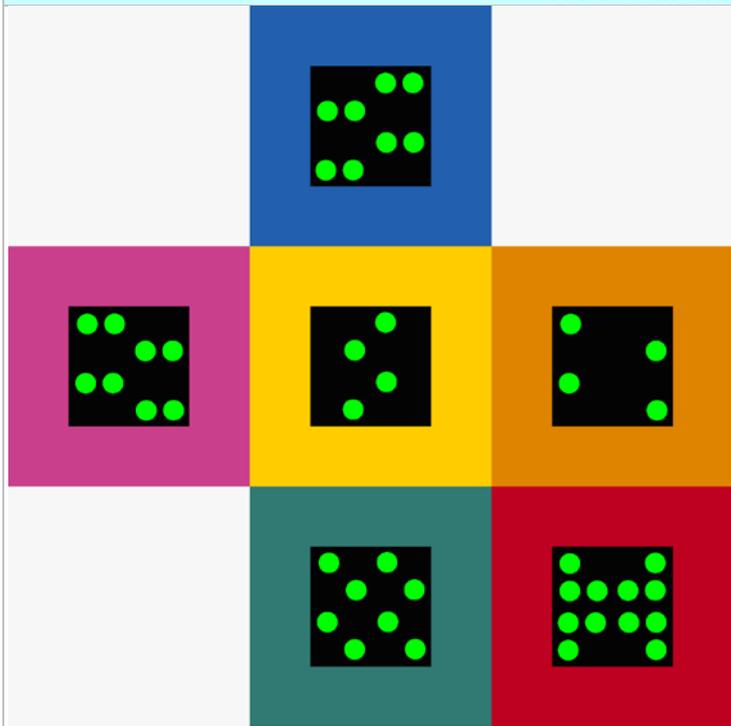

## Selecting Dot Matrix Cube Patterns

There is a total of 16 different patterns for 24 center cubes. So, we have to make a choice on the most suitable patterns. Patterns P1 – P12 have been selected as explained below:

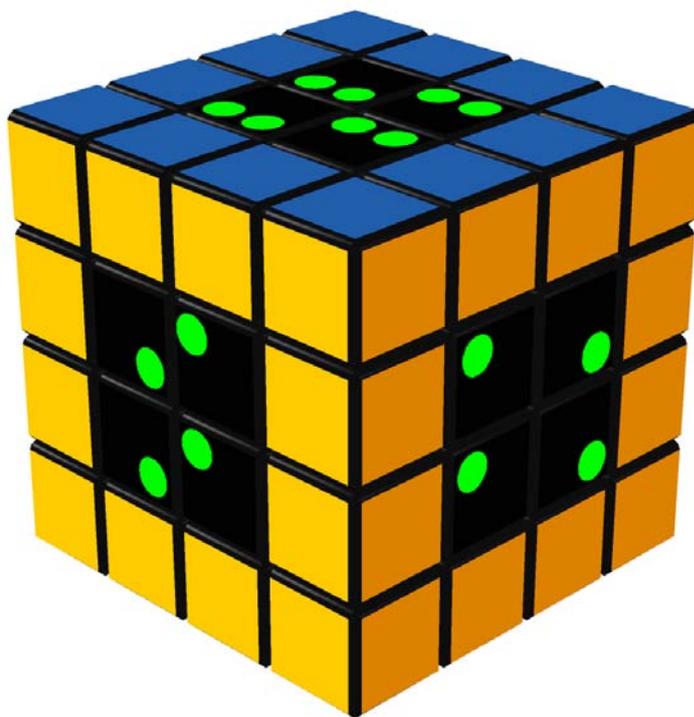

- 1- There is no unique choice: other patterns could also have been selected as well.
- 2- Only 12 basic patterns have been selected. The other 12 patterns are the same but obtained through a 180° rotation.
- 3- All 1- and 2-dot basic patterns have been selected.
- 4- Only two out of four 3-dot basic patterns have been selected.
- 5- 0- and 4-dot patterns have not been selected.

# Examples of Dot Matrix Patterns on Center Cubes

## R4 Dot Matrix Cube (Demo)

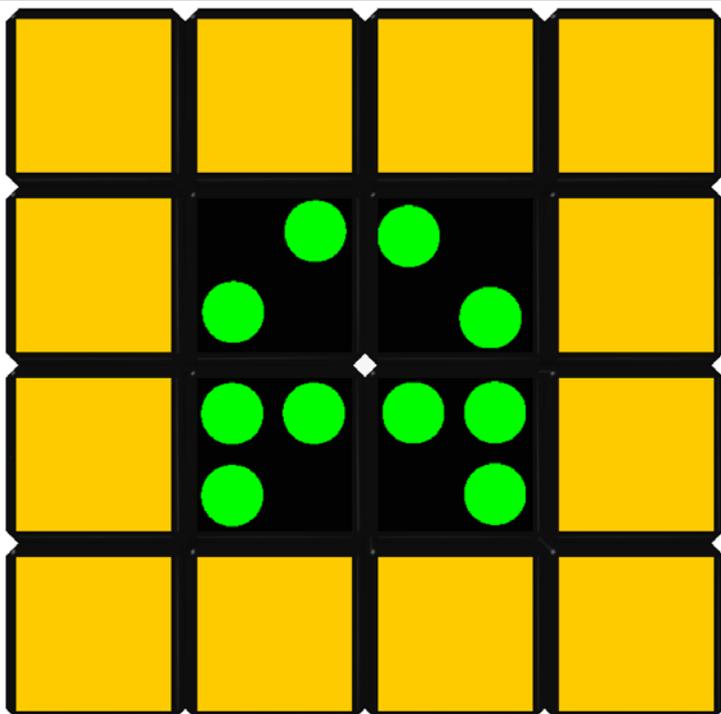

Texture

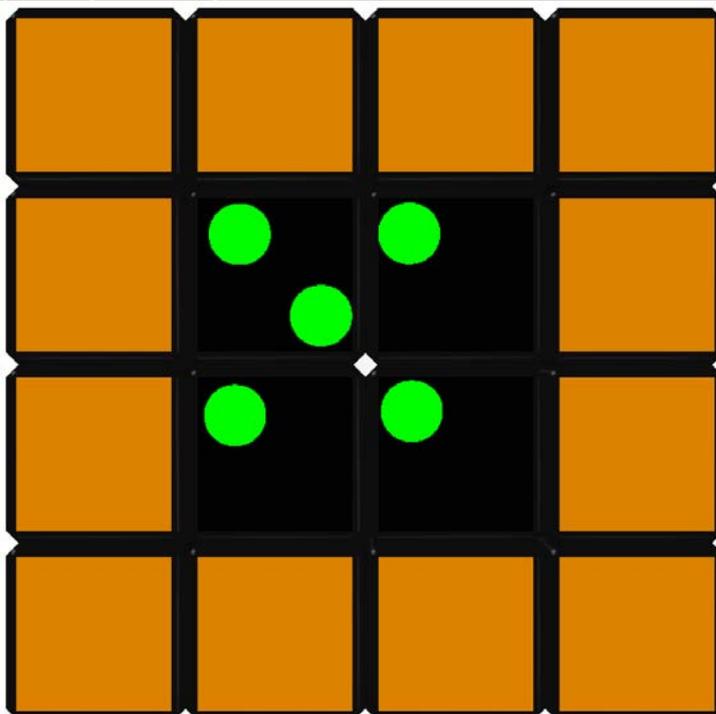

Virtual Cube

## R4 Dot Matrix Cube (Demo) – Examples

Virtual Cube (Capital Letter 'A') – Front Face

Virtual Cube (Small Letter 'x') – Right Face

### Synthesized Algorithm (Letter 'A')

B' MD' MB MD MB' ML MB' ML' MB B2 MD' MF' MD MF MR MF' MR' MF B' MR' MF' MR MF MB ML' MB' ML

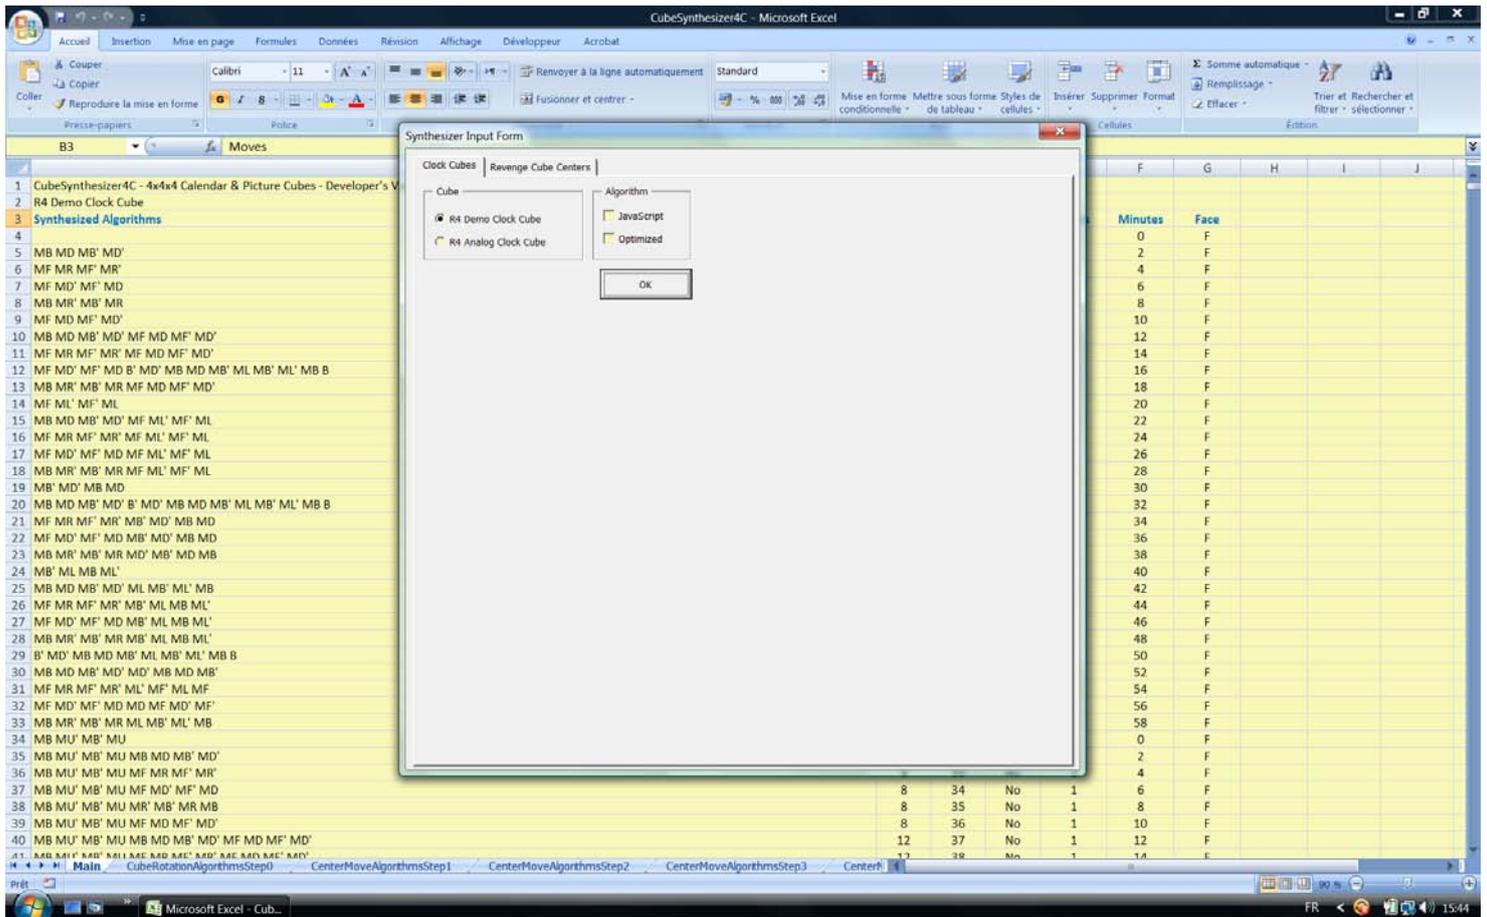

### Synthesized Algorithm (Letter 'x')

CU MF MD' MF' MD MF MU MF' MB' MU' MB

Note that center cubes would normally not be used for displaying *full-size* letters. This would be done using *all* 16 cubies and would not be limited to 4 cubies only. A normal 4x4x4 Dot matrix Cube would then use dot patterns on corners, edges and centers. So, this is for demo only.

# Example #3: Clock Cube (Demo)

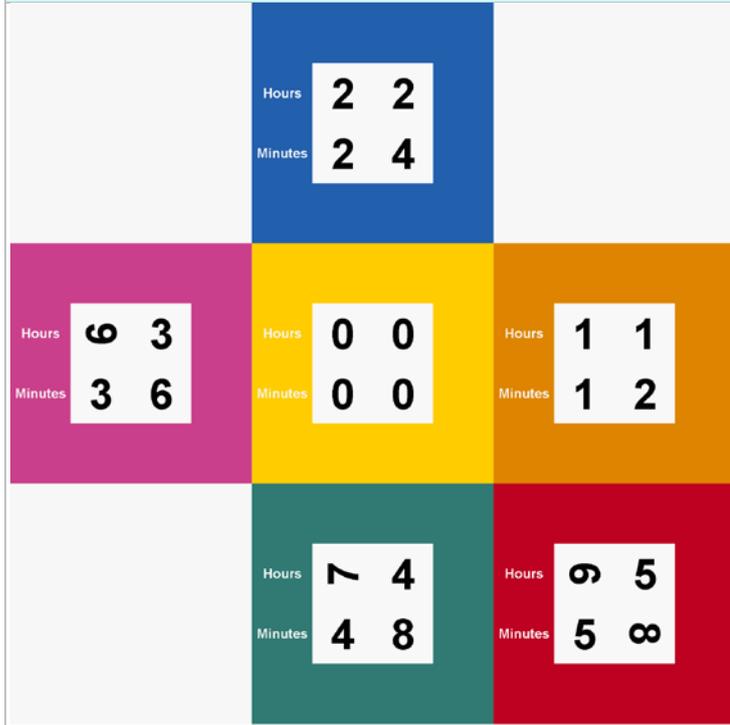

## Synthesizer Input Form Example

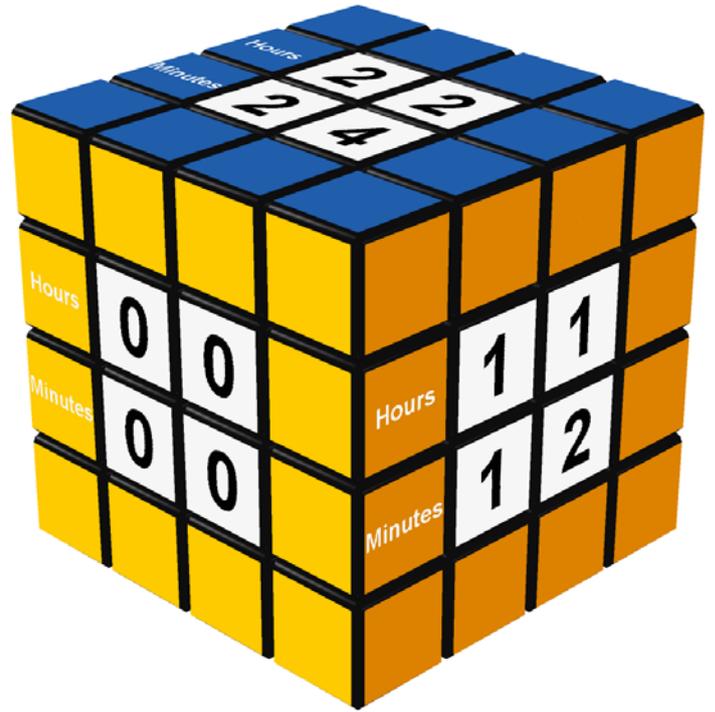

This example shows how to use an Input Form for synthesizing algorithms. We can see that the R4 Demo Clock Cube has been selected. Note that by unchecking the 'Optimized' CheckBox, *un-optimized* algorithms are displayed. This can be used for speeding the display of algorithms because in this case, Synthesizer routines are executed only once per algorithm. Otherwise, execution time would be 24 times longer...but at least 10% of synthesized algorithms would be shorter.

# Examples of [Hours Minutes] on Center Cubes

## R4 Clock Cube (Demo)

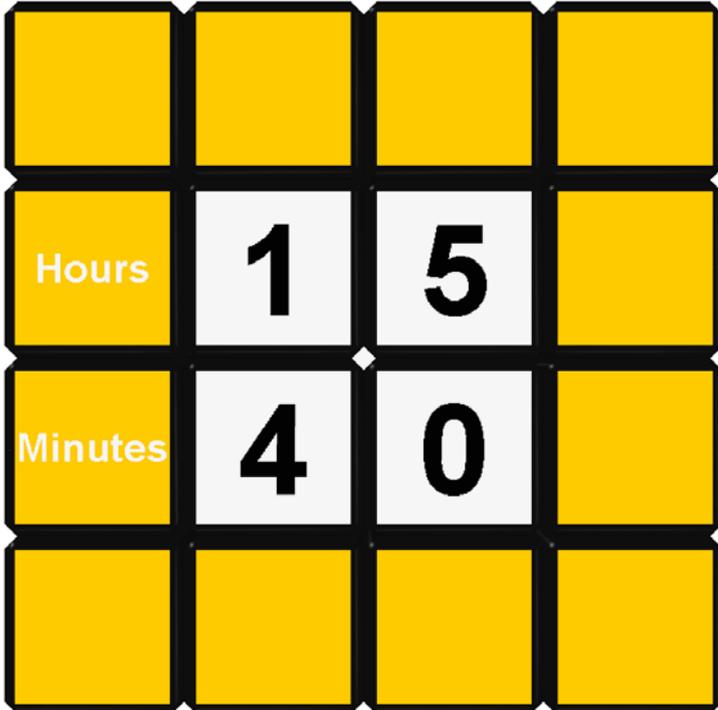

Texture

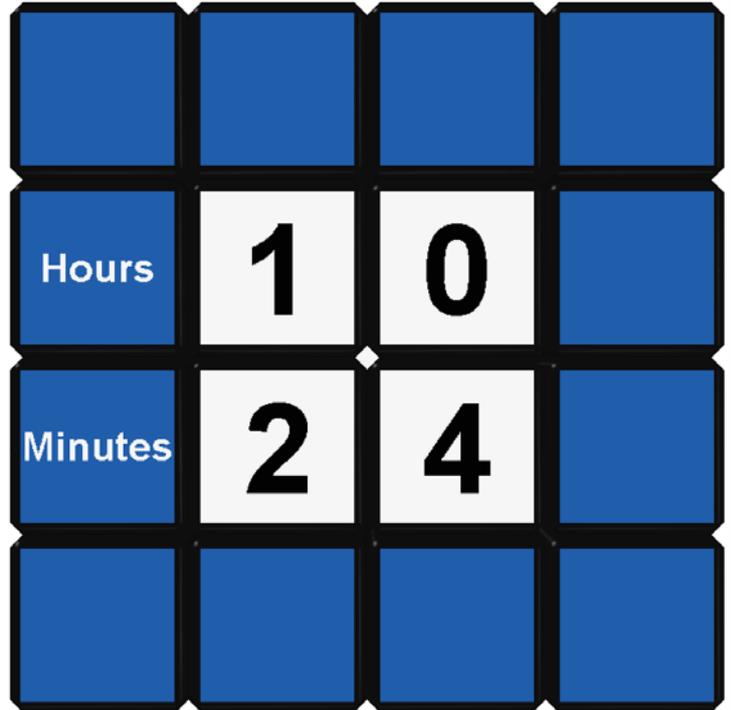

Virtual Cube

## R4 Clock Cube (Demo) – Examples

Virtual Cube (15:40) – Front Face

Virtual Cube (10:24) – Up Face

Synthesized Algorithm (15:40)

MB' ML MB ML' MF' MU' MF MU2 MF' MU' MF

Synthesized Algorithm (10:24)

CR' ML MF ML' MR' MF' MR

The cube can display the time of the day from 00:00 up to 23:58 in 2-minute steps *on any face*.

Note that *all* 16 cubies would normally be used for a fully designed Clock & Calendar Cube. The design would then not be limited to the 4 center cubies. So, this is for demo only.

## R4 Cube Rotation Algorithms (Check: done)

## R4 Center Move Algorithms – Set 0 (Check: **done**)

Front face center cubies other than the origin and destination center cubies **do not** move.

Right face center cubies **do not** move, therefore algorithms of Set 0 are longer than those of Set 1.

Algorithms have been selected to be the shortest for displaying 3-, 4- or 6-dot patterns on a 4x4x4 cube.

## 4x4x4 Cube Wire Grid Model

Using a wire grid model, it is easy to see through the cube where letters are. This model can be used with pencil and rubber to find a path on the cube.

This model may be used to find algorithms for moving a single character from a location to another.
